

NIVS Update 22nd January 2021

Dear Colleagues

A successful upgrade of the NIVS Platform was undertaken last night. The system was accessible from 1:00 am this morning.

Further to the comms yesterday, wanted to bring to your attention some additional functionality to support the new pre-screening process.

For those sites using a two stage process of recording pre screening in one room with the patient, then the patient moves to another for recording of their vaccination, the application allows you to search for records that have already been pre-screened and will deliver a short cut option to find those records.

Click on the pre-screening link, a search screen defaults to all, untick to search for a specific patient or use the all function to bring back a list of all those patients with a pre-screening completed who have yet to have a vaccination recorded.

Pre-screening Search

NHS Number	Forename	Surname	DOB
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text" value="dd/mm/yyyy"/> 
Pre-screening Date			
<input type="text" value="dd/mm/yyyy"/> 		<input checked="" type="checkbox"/> All	<input type="button" value="Search"/>

In addition, we have not released the functionality for monitoring, as requirements needed further refinement and discussion, therefore this release has been delayed until that has been finalised with the national program.
